

## ***Artificial Intelligence and Human Rights: New Horizons in European Legal Protection***

**24 April 2025**

**(Human Rights Building, Seminar Room)**

### **Navigating the Uncharted Terrain of AI and Human Rights**

In an era of unprecedented technological transformation, artificial intelligence stands at the critical intersection of innovation and human dignity. As AI systems increasingly penetrate the most intimate spheres of human experience—adjudicating rights, mediating social interactions, and reshaping individual autonomy—international legal institutions face an existential challenge: How do we preserve the fundamental principles of human rights in a landscape increasingly governed by algorithmic logic?

This conference represents a pivotal moment of collective reflection by key legal academics and international judges. We stand at a watershed where technological capability must be harmonized with ethical imperatives, where the abstract principles of human rights must be translated into concrete protections against the potential depersonalization of technological systems. Our goal transcends mere academic discourse; we seek to construct a normative framework that anticipates and mitigates the profound human rights challenges emerging from AI's rapid evolution.

By bringing together the judicial wisdom of the European Court of Human Rights and the scholarly depth of international legal experts, we aspire to develop a sophisticated, forward-looking approach that:

- *Recognizes AI as a dynamic field requiring adaptive legal interpretation.*
- *Preserves human agency and individual dignity in technological ecosystems.*
- *Considers anticipatory legal mechanisms that protect fundamental rights.*
- *Establishes international collaborative standards for responsible AI governance.*
